	the LINC (LInker of Nucleoskeleton and Cytoskeleton) complex involved in the connection
	between the nuclear lamina and the cytoskeleton. The nucleocytoplasmic interactions
	established by the LINC complex play an important role in the transmission of mechanical
	forces across the nuclear envelope and in nuclear movement and positioning. Specifically,
	SYNE2 and SUN2 assemble in arrays of transmembrane actin-associated nuclear (TAN) lines
	which are bound to F-actin cables and couple the nucleus to retrograde actin flow during actin-
	dependent nuclear movement. May be involved in nucleus-centrososme attachment. During
	interkinetic nuclear migration (INM) at G2 phase and nuclear migration in neural progenitors its
	LINC complex association with SUN1/2 and probable association with cytoplasmic dynein-
	dynactin motor complexes functions to pull the nucleus toward the centrosome, SYNE1 and
	SYNE2 may act redundantly. During INM at G1 phase mediates respective LINC complex
	association with kinesin to push the nucleus away from the centrosome. Involved in nuclear
	migration in retinal photoreceptor progenitors. Required for centrosome migration to the apical
	cell surface during early ciliogenesis.
