sequence. Considered to have intrinsic transcriptional activity, have some natural ligands such
as all-trans retinoic acid (ATRA) and other retinoids which act as inverse agonists repressing
the transcriptional activity. Required for normal postnatal development of rod and cone
photoreceptor cells. Modulates rod photoreceptors differentiation at least by inducing the
transcription factor NRL-mediated pathway. In cone photoreceptor cells, regulates transcription
of OPN1SW. Involved in the regulation of the period length and stability of the circadian rhythm.
May control cytoarchitectural patterning of neocortical neurons during development. May act in
a dose-dependent manner to regulate barrel formation upon innervation of layer IV neurons by
thalamocortical axons. May play a role in the suppression of osteoblastic differentiation
through the inhibition of RUNX2 transcriptional activity (By similarity).
