	to phosphatidylglycerol (PG). PGP is an essential intermediate in the biosynthetic pathway of
	cardiolipin, a mitochondrial-specific phospholipid regulating the membrane integrity and
	activities of the organelle. Has also been shown to display phosphatase activity toward
	phosphoprotein substrates, specifically mediates dephosphorylation of mitochondrial proteins,
	thereby playing an essential role in ATP production. Has probably a preference for proteins
	phosphorylated on Ser and/or Thr residues compared to proteins phosphorylated on Tyr
	residues. Probably involved in regulation of insulin secretion in pancreatic beta cells.
