| | phospholipids. Phospholipid translocation seems also to be implicated in vesicle formation and |
| | in uptake of lipid signaling molecules. In vitro, its ATPase activity is selectively and |
| | stereospecifically stimulated by phosphatidylserine (PS). The flippase complex |
| | ATP8A1:TMEM30A seems to play a role in regulation of cell migration probably involving |
| | flippase-mediated translocation of phosphatidylethanolamine (PE) at the plasma membrane. |
