actin capping protein (CP). May function to target CK2 to the plasma membrane thereby
serving as an adapter to facilitate the phosphorylation of CP by protein kinase 2 (CK2). Appears
to target ATM to the plasma membrane. Appears to also inhibit tumor cell growth by inhibiting
AKT-mediated cell-survival. Also implicated in PI3K-regulated muscle differentiation, the
regulation of AP-1 activity (plasma membrane bound AP-1 regulator that translocates to the
nucleus) and the promotion of apoptosis induced by tumor necrosis factor TNF. When bound
to PKB, it inhibits it probably by decreasing PKB level of phosphorylation.
