	membranes. Assuming opened or closed conformations in response to the voltage difference
	across the membrane, the protein forms a potassium-selective channel through which
	potassium ions may pass in accordance with their electrochemical gradient. Can form
	functional homotetrameric channels and heterotetrameric channels that contain variable
	proportions of KCNC2, and possibly other family members as well. Contributes to fire sustained
	trains of very brief action potentials at high frequency in pallidal neurons.
