	channel complex of pore-forming alpha subunits. Modulates the gating kinetics and enhances
	stability of the channel complex. Assembled with KCNB1 modulates the gating characteristics
	of the delayed rectifier voltage-dependent potassium channel KCNB1 (PubMed:19219384).
	Assembled with KCNQ1/KVLQT1 is proposed to form the slowly activating delayed rectifier
	cardiac potassium (IKs) channel. The outward current reaches its steady state only after 50
	seconds. Assembled with KCNH2/HERG may modulate the rapidly activating component of the
	delayed rectifying potassium current in heart (IKr).
