	GZMA-activated DNase, NME1. In the course of cytotoxic T-lymphocyte (CTL)-induced
	apoptosis, GZMA cleaves SET, disrupting its binding to NME1 and releasing NME1 inhibition.
	Isoform 1 and isoform 2 are potent inhibitors of protein phosphatase 2A. Isoform 1 and isoform
	2 inhibit EP300/CREBBP and PCAF-mediated acetylation of histones (HAT) and nucleosomes,
	most probably by masking the accessibility of lysines of histones to the acetylases. The
	predominant target for inhibition is histone H4. HAT inhibition leads to silencing of HAT-
	dependent transcription and prevents active demethylation of DNA. Both isoforms stimulate
	DNA replication of the adenovirus genome complexed with viral core proteins, however, isoform
	2 specific activity is higher.
