	autophagosome formation through direct interaction with Atg16L1. Required for the formation
	of the autophagosome-like double-membrane structure that surrounds the Salmonella-
	containing vacuole (SCV) duting S.typhimurium infection and subsequent xenophagy.
	Autophagy positively regulates repair of DNA damage induced by ionizing radiation and
	negatively regulates apoptosis. Plays an indispensible role in fetal hematopoiesis and in the
	regulation of neuronal homeostasis (By similarity). Implicated in the regulation of RB1
	expression. Functions as a DNA-binding transcription factor. Is a potent regulator of the RB1
	pathway and a mediator that plays a crucial role in muscular differentiation. Expression is, thus,
	a prerequisite for myogenic differentiation. Inhibits PTK2/FAK1 and PTK2B/PYK2 activity and
	activation of downstream signaling pathways.
