between the EJC core and NMD machinery. Recruits UPF2 at the cytoplasmic side of the
nuclear envelope and the subsequent formation of an UPF1-UPF2-UPF3 surveillance complex
(including UPF1 bound to release factors at the stalled ribosome) is believed to activate NMD.
In cooperation with UPF2 stimulates both ATPase and RNA helicase activities of UPF1. Binds
spliced mRNA upstream of exon-exon junctions. In vitro, stimulates translation, the function is
independent of association with UPF2 and components of the EJC core.
