	highly specific holoenzymes which dephosphorylate hundreds of biological targets. Protein
	phosphatase (PP1) is essential for cell division, it participates in the regulation of glycogen
	metabolism, muscle contractility and protein synthesis. Involved in regulation of ionic
	conductances and long-term synaptic plasticity. Component of the PTW/PP1 phosphatase
	complex, which plays a role in the control of chromatin structure and cell cycle progression
	during the transition from mitosis into interphase. In balance with CSNK1D and CSNK1E,
	determines the circadian period length, through the regulation of the speed and rhythmicity of
	PER1 and PER2 phosphorylation. May dephosphorylate CSNK1D and CSNK1E.
	Dephosphorylates the \\\'Ser-418\\\' residue of FOXP3 in regulatory T-cells (Treg) from patients
	with rheumatoid arthritis, thereby inactivating FOXP3 and rendering Treg cells functionally
	defective (PubMed:23396208).
