	nucleocytoplasmic interactions established by the LINC complex play an important role in the
	transmission of mechanical forces across the nuclear envelope and in nuclear movement and
	positioning. Specifically, SYNE2 and SUN2 assemble in arrays of transmembrane actin-
	associated nuclear (TAN) lines which are bound to F-actin cables and couple the nucleus to
	retrograde actin flow during actin-dependent nuclear movement. Required for interkinetic
	nuclear migration (INM) and essential for nucleokinesis and centrosome-nucleus coupling
	during radial neuronal migration in the cerebral cortex and during glial migration. Required for
	nuclear migration in retinal photoreceptor progenitors implicating association with cytoplasmic
	dynein-dynactin and kinesin motor complexes, and probably B-type lamins, SUN1 and SUN2
	seem to act redundantly. The SUN1/2:KASH5 LINC complex couples telomeres to microtubules
	during meiosis, SUN1 and SUN2 seem to act at least partial redundantly. Anchors chromosome
	movement in the prophase of meiosis and is involved in selective gene expression of coding
	and non-coding RNAs needed for gametogenesis. Required for telomere attachment to nuclear
	envelope and gametogenesis. May also function on endocytic vesicles as a receptor for RAB5-
	GDP and participate in the activation of RAB5.
