	protein (GAP) activity toward RHEB in response to alterations in specific cellular growth
	conditions. The small GTPase RHEB is a direct activator of the protein kinase activity of
	mTORC1 and the TSC-TBC complex acts as a negative regulator of mTORC1 signaling cascade
	by acting as a GAP for RHEB. Participates in the proper sensing of growth factors and glucose,
	but not amino acids, by mTORC1. It is unclear whether TBC1D7 acts as a GTPase-activating
	protein and additional studies are required to answer this question.
