| extracellular stimuli, cell motility and adhesion and receptor endocytosis. Coordinates actin |
|---|
| remodeling through tyrosine phosphorylation of proteins controlling cytoskeleton dynamics like |
| MYH10 (involved in movement), CTTN (involved in signaling), or TUBA1 and TUBB (microtubule |
| subunits). Binds directly F-actin and regulates actin cytoskeletal structure through its F-actin- |
| bundling activity. Involved in the regulation of cell adhesion and motility through |
| phosphorylation of key regulators of these processes such as CRK, CRKL, DOK1 or ARHGAP35. |
| Adhesion-dependent phosphorylation of ARHGAP35 promotes its association with RASA1, |
| resulting in recruitment of ARHGAP35 to the cell periphery where it inhibits RHO. |
| Phosphorylates multiple receptor tyrosine kinases like PDGFRB and other substrates which are |
| involved in endocytosis regulation such as RIN1. In brain, may regulate neurotransmission by |
| phosphorylating proteins at the synapse. ABL2 acts also as a regulator of multiple pathological |
| signaling cascades during infection. Pathogens can highjack ABL2 kinase signaling to |
| reorganize the host actin cytoskeleton for multiple purposes, like facilitating intracellular |
| movement and host cell exit. Finally, functions as its own regulator through autocatalytic |
| activity as well as through phosphorylation of its inhibitor, ABI1. |
