	This type of poly-ubiquitination activates IKK and does not seem to involve protein degradation
	by the proteasome. Plays a role in the activation of NF-kappa-B mediated by IL1B, TNF, TRAF6
	and TRAF2. Mediates transcriptional activation of target genes. Plays a role in the control of
	progress through the cell cycle and differentiation. Plays a role in the error-free DNA repair
	pathway and contributes to the survival of cells after DNA damage. Promotes TRIM5 capsid-
	specific restriction activity and the UBE2V1-UBE2N heterodimer acts in concert with TRIM5 to
	generate \'Lys-63\'-linked polyubiquitin chains which activate the MAP3K7/TAK1 complex
	which in turn results in the induction and expression of NF-kappa-B and MAPK-responsive
	inflammatory genes.
