	compartments, which are then moved relative to actin filaments. Binds to membranes
	containing anionic phospholipids via its tail domain. Required for normal morphology of the
	glomerular basement membrane, normal development of foot processes by kidney podocytes
	and normal kidney function. In dendritic cells, may control the movement of class II-containing
	cytoplasmic vesicles along the actin cytoskeleton by connecting them with the actin network
	via ARL14EP and ARL14.
