Target Details

Ribosomal Protein L19, Ribosomal protein L19, cytosolic, N terminus truncated, RL19_HUMAN.
Background: Ribosomes, the organelles that catalyze protein synthesis, consist of a small 40S
subunit and a large 60S subunit. Together these subunits are composed of 4 RNA species and
approximately 80 structurally distinct proteins. This gene encodes a ribosomal protein that is a
component of the 60S subunit. The protein belongs to the L19E family of ribosomal proteins. It
is located in the cytoplasm. As is typical for genes encoding ribosomal proteins, there are
multiple processed pseudogenes of this gene dispersed through the genome.

Gene ID: 6143
