Target Details

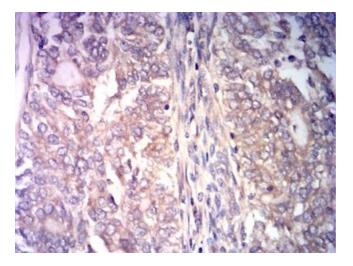

Target:	Cyclin E1 (CCNE1)
Alternative Name:	CCNE1 (CCNE1 Products)
Background:	Description: The protein encoded by this gene belongs to the highly conserved cyclin family,
	whose members are characterized by a dramatic periodicity in protein abundance through the
	cell cycle. Cyclins function as regulators of CDK kinases. Different cyclins exhibit distinct
	expression and degradation patterns which contribute to the temporal coordination of each

	mitotic event. This cyclin forms a complex with and functions as a regulatory subunit of CDK2,
	whose activity is required for cell cycle G1/S transition. This protein accumulates at the G1-S
	phase boundary and is degraded as cells progress through S phase. Overexpression of this
	gene has been observed in many tumors, which results in chromosome instability, and thus
	may contribute to tumorigenesis. This protein was found to associate with, and be involved in,
	the phosphorylation of NPAT protein (nuclear protein mapped to the ATM locus), which
	participates in cell-cycle regulated histone gene expression and plays a critical role in
	promoting cell-cycle progression in the absence of pRB. [provided by RefSeq, Apr 2016]
