Natural killer (NK) cells are lymphocytes that can mediate lysis of certain tumo	or cells and virus-
infected cells without previous activation. They can also regulate specific hum	oral and cell-
mediated immunity. NK cells preferentially express several calcium-dependent	t (C-type) lectins,
which have been implicated in the regulation of NK cell function. The NKG2 ge	ene family is
located within the NK complex, a region that contains several C-type lectin ger	nes preferentially
expressed in NK cells. This gene encodes a member of the NKG2 family. The e	encoded
transmembrane protein is characterized by a type II membrane orientation (ha	as an extracellular
C terminus) and the presence of a C-type lectin domain. It binds to a diverse fa	amily of ligands
that include MHC class I chain-related A and B proteins and UL-16 binding pro-	teins, where
ligand-receptor interactions can result in the activation of NK and T cells. The	surface
expression of these ligands is important for the recognition of stressed cells b	y the immune
system, and thus this protein and its ligands are therapeutic targets for the tre	atment of
immune diseases and cancers. Read-through transcription exists between this	s gene and the
upstream KLRC4 (killer cell lectin-like receptor subfamily C, member 4) family	member in the
same cluster.
