	cysteine peptidase that is highly conserved through evolution. The only known activity of the
	enzyme is metabolic inactivation of the glycopeptide bleomycin (BLM), an essential component
	of combination chemotherapy regimens for cancer. The papain superfamily member bleomycin
	hydrolase (BLMH) is a neutral cysteine protease with structural similarity to a 20S proteasome.
	Bleomycin (BLM), a clinically used glycopeptide anticancer agent. BLMH is an essential
	protectant against BLM-induced death and has an important role in neonatal survival and in
	maintaining epidermal integrity. Sequencing revealed several putative sites phosphorylated by
	different types of protein kinases, but no signal sequence, transmembrane domain, N-linked
	glycosylation site or DNA-binding motif.
