Alternative Name:	IL18R1 (IL18R1 Products)
Background:	Background: Interleukin-18 receptor 1 (IL18R1) also known as CD218 antigen-like family member A, CDw218a, IL1 receptor-related protein and CD218a, is an interleukin receptor of the
	immunoglobulin superfamily. IL18R1 is found expressed in lung, leukocytes, spleen, liver,

	thymus, prostate, small intestine, colon, placenta, and heart, and is absent from brain, skeletal				
	muscle, pancreas, and kidney. High level of expression is found in Hodgkin disease cell lines.				
	This receptor is specifically binds interleukin 18 (IL18), and is essential for IL18 mediated signal				
	transduction. IL18R1 contains 3 Ig-like C2-type (immunoglobulin-like) domains and 1 TIR				
	domain. It is a single-pass type I membrane protein. IFN-alpha and IL12 are reported to induce				
	the expression of this receptor in NK and T cells. The increased expression of IL18R1 may contribute pathogenically to disease and is therefore a potential therapeutic target. The absence of a genetic association in the IL18R1 gene itself suggests regulation from other parts				
	of the genome, or as part of the inflammatory cascade in multiple sclerosis without a prime				
	genetic cause.				
	Synonym: IL18R1
