|-------------------|---|
| Alternative Name: | Pepsinogen C/PGC (PGC Products) |
| Background: | Background: Pepsinogen C, also known as PGC, is an aspartic proteinase that belongs to the peptidase family A1. Pepsinogen C is synthesized in the gastric mucosa as inactive precursors, |
| | known as zymogens. Pepsinogen C contains a prosegment that serves to stabilize the inactive |

| | form and prevent entry of the substrate to the active site. At low PH conditions, Pepsinogen C |
|---------------------|--|
| | undergoes conversion into active enzyme. Pepsinogen C has been found expressed in all |
| | regions of the stomach mucosa and also in the proximal duodenal mucosa. In stomach cancer |
| | tissues and cancer cell lines, the expressions of the pepsinogen genes were decreased or lost, |
| | in good accordance with their pepsinogen productions. No gross structural changes of the |
| | pepsinogen genes were observed in these cancers, but the methylation patterns of the |
| | pepsinogen genes were found to be altered in different ways in different cancers. Serum levels |
| | of Pepsinogen C are used as a biomarker for certain gastric diseases including Helicobacter |
| | pylori related gastritis. |
