	Background: This gene encodes a member of the family of carcinoembryonic antigen-related
	cell adhesion molecules (CEACAMs), which are used by several bacterial pathogens to bind and
	invade host cells. The encoded transmembrane protein directs phagocytosis of several
	bacterial species that is dependent on the small GTPase Rac. It is thought to serve an
	important role in controlling human-specific pathogens by the innate immune system.
	Alternatively spliced transcript variants have been described, but their biological validity has not
	been determined. [provided by RefSeq, Jul 2008].
