## Target Details

	Background: The product of this gene belongs to the family of highly homologous synovial
	sarcoma X (SSX) breakpoint proteins. These proteins may function as transcriptional
	repressors. They are also capable of eliciting spontaneously humoral and cellular immune
	responses in cancer patients, and are potentially useful targets in cancer vaccine-based
	immunotherapy. SSX1, SSX2 and SSX4 genes have been involved in the t(X,18) translocation
	characteristically found in all synovial sarcomas. This gene appears not to be involved in this
	type of chromosome translocation. Two transcript variants encoding distinct isoforms have
	been identified for this gene.
