	Background: Interferons(IFNs) are proteins made and released by host cells in response to the
	presence of pathogens such as viruses, bacteria, parasites or tumor cells. They belong to the
	large class of glycoproteins known as cytokines. IFNs stimulate the production of two
	enzymes: a protein kinase and an oligoadenylate synthetase. They allow for communication
	between cells to trigger the protective defenses of the immune system that eradicate
	pathogens or tumors. IFNs can activate immune cells, such as natural killer cells and
	macrophages, they increase recognition of infection or tumor cells by up-regulating antigen
	presentation to T lymphocytes, and they also increase the ability of uninfected host cells to
	resist new infection by virus. Leukocyte interferon is produced predominantly by B
	lymphocytes. Immune interferon is produced by mitogen- or antigen-stimulated T lymphocytes.
