	Background: Stabilin-1 is a large transmembrane receptor protein which may function in
	angiogenesis, lymphocyte homing, cell adhesion, or receptor scavenging. The protein contains
	7 fasciclin, 16 epidermal growth factor (EGF)-like, and 2 laminin-type EGF-like domains as well
	as a C-type lectin-like hyaluronan-binding Link module. The protein is primarily expressed on
	sinusoidal endothelial cells of liver, spleen, and lymph node. The receptor has been shown to
	endocytose ligands such as low density lipoprotein, Gram-positive and Gram-negative bacteria,
	and advanced glycosylation end products. Supporting its possible role as a scavenger receptor,
	the protein rapidly cycles between the plasma membrane and early endosomes.
