## Target Details

Target:	Synaptotagmin 3 (SYT3)
Alternative Name:	SYT3 (SYT3 Products)
Background:	Synaptotagmins are a large gene family of synaptic vesicle type III integral membrane proteins that function as regulators of both exocytosis and endocytosis and are involved in
	neurotransmitter secretion from small secretory vesicles. Calcium binds to Synaptotagmin I
	which triggers neurotransmitter release at the synapse. Synaptotagmin II is phosphorylated by

	WNK1 in a process that regulates calcium-dependent interactions. Synaptotagmin III is involved
	in calcium-dependent exocytosis of secretory vesicles in endocrine cells and neurons.
	Synaptotagmin IV is expressed in neuronal tissues, and has the highest mRNA levels in the
	hippocampus. The proximity of the Synaptotagmin IV gene to markers of several psychiatric
	disorders suggest an involvement of synaptotagmin IV in human disease. Synaptotagmin V is a
	dense-core vesicle-specific protein that regulates a specific type of calcium-regulated secretion.
	Synaptotagmin VI interacts with adaptor protein-2 in a calcium-independent manner.
	Synaptotagmin VII is widely expressed in non-neuronal tissues.
