Background:	The cystatin superfamily encompasses proteins that contain multiple cystatin-like sequences. Some of the members are active cysteine protease inhibitors, while others have lost or perhaps
	never acquired this inhibitory activity. There are three inhibitory families in the superfamily,
	including the type 1 cystatins (stefins), type 2 cystatins and the kininogens. The type 2 cystatin

	proteins are a class of cysteine proteinase inhibitors found in a variety of human fluids and
	secretions, where they appear to provide protective functions. This gene encodes a cystatin
	from the type 2 family, which is down-regulated in metastatic breast tumor cells as compared
	to primary tumor cells. Loss of expression is likely associated with the progression of a primary
	tumor to a metastatic phenotype.
