	Background: Secretin belongs to the glucagon family. This protein is an endocrine hormone and
	its major site of production is the endocrine S cells located in the proximal small intestinal
	mucosa. The release of active secretin is stimulated by either fatty acids or an acidic pH in the
	duodenum. This hormone stimulates the secretion of bicarbonate-rich pancreatic fluids and
	has also been shown to regulate the growth and development of the stomach, small intestine,
	and pancreas. Secretin deficiency has been implicated in autistic syndrome, suggesting that the
	hormone could have a neuroendocrine function in addition to its role in digestion.
