Target Details

Target:	DUSP12
Alternative Name:	DUSP12 (DUSP12 Products)
Background:	The protein encoded by this gene is a member of the dual specificity protein phosphatase
	subfamily. These phosphatases inactivate their target kinases by dephosphorylating both the
	phosphoserine/threonine and phosphotyrosine residues. They negatively regulate members of
	the mitogen-activated protein (MAP) kinase superfamily (MAPK/ERK, SAPK/JNK, p38), which is

associated with cellular proliferation and differentiation. Different members of the family of dual specificity phosphatases show distinct substrate specificities for various MAP kinases, different tissue distribution and subcellular localization, and different modes of inducibility of their expression by extracellular stimuli. This gene product is the human ortholog of the Saccharomyces cerevisiae YVH1 protein tyrosine phosphatase. It is localized predominantly in the nucleus, and is novel in that it contains, and is regulated by a zinc finger domain.
