### **Target Details**

Target:	BCL3
Alternative Name:	BCL3 (BCL3 Products)
Background:	This gene is a proto-oncogene candidate. It is identified by its translocation into the
	immunoglobulin alpha-locus in some cases of B-cell leukemia. The protein encoded by this
	gene contains seven ankyrin repeats, which are most closely related to those found in I kappa B
	proteins. This protein functions as a transcriptional co-activator that activates through its

	association with NF-kappa B homodimers. The expression of this gene can be induced by NF-kappa B, which forms a part of the autoregulatory loop that controls the nuclear residence of p50 NF-kappa B.
