	phosphoserine/threonine and phosphotyrosine residues. They negatively regulate members of
	the mitogen-activated protein (MAP) kinase superfamily (MAPK/ERK, SAPK/JNK, p38), which
	are associated with cellular proliferation and differentiation. Different members of the family of
	dual specificity phosphatases show distinct substrate specificities for various MAP kinases,
	different tissue distribution and subcellular localization, and different modes of inducibility of
	their expression by extracellular stimuli. This gene maps in a region that contains the BRCA1
	locus which confers susceptibility to breast and ovarian cancer. Although DUSP3 is expressed
	in both breast and ovarian tissues, mutation screening in breast cancer pedigrees and in
	sporadic tumors was negative, leading to the conclusion that this gene is not BRCA1.
