Background:	Synonyms: NT3, HDNF, NGF2, NT-3, NGF-2, Neurotrophin-3, Nerve growth factor 2,
	Neurotrophic factor, NTF3
	Background: The protein encoded by this gene is a member of the neurotrophin family, that
	controls survival and differentiation of mammalian neurons. This protein is closely related to
	both nerve growth factor and brain-derived neurotrophic factor. It may be involved in the
	maintenance of the adult nervous system, and may affect development of neurons in the
	embryo when it is expressed in human placenta. NTF3-deficient mice generated by gene
	targeting display severe movement defects of the limbs. The mature peptide of this protein is
	identical in all mammals examined including human, pig, rat and mouse. [provided by RefSeq,
	Jul 2008].
