#### **Target Details**

Target:	PUM1
Alternative Name:	pum1 (PUM1 Products)
Background:	This gene encodes a member of the PUF family, evolutionarily conserved RNA-binding proteins
	related to the Pumilio proteins of Drosophila and the fem-3 mRNA binding factor proteins of C.
	elegans. The encoded protein contains a sequence-specific RNA binding domain comprised of
	eight repeats and N- and C-terminal flanking regions, and serves as a translational regulator of

specific mRNAs by binding to their 3' untranslated regions. The evolutionarily conserved function of the encoded protein in invertebrates and lower vertebrates suggests that the human protein may be involved in translational regulation of embryogenesis, and cell development and differentiation. Alternatively spliced transcript variants encoding different isoforms have been described.
