	Background: Acts as an interface between multiple growth factor receptors possessing tyrosine
	kinase activity, such as insulin receptor, IGF1R and FGFR1, and a complex network of
	intracellular signaling molecules containing SH2 domains. Involved in the IGF1R mitogenic
	signaling pathway. Promotes the AKT1 signaling pathway and BAD phosphorylation during
	insulin stimulation without activation of RPS6KB1 or the inhibition of apoptosis. Interaction with
	GRB2 enhances insulin-stimulated mitogen-activated protein kinase activity. May be involved in
	nonreceptor tyrosine kinase signaling in myoblasts. Plays a pivotal role in the
	proliferation/differentiation of hepatoblastoma cell through EPHB2 activation upon IGF1
	stimulation. May play a role in the signal transduction in response to insulin and to a lesser
	extent in response to IL4 and GH on mitogenesis. Plays a role in growth, reproduction and
	glucose homeostasis. May act as negative regulators of the IGF1 signaling pathway by
	suppressing the function of IRS1 and IRS2.
