Background:	The 26S proteasome is a multicatalytic proteinase complex with a highly ordered structure composed of 2 complexes, a 20S core and a 19S regulator. The 20S core is composed of 4
	rings of 28 non-identical subunits, 2 rings are composed of 7 alpha subunits and 2 rings are
	composed of 7 beta subunits. The 19S regulator is composed of a base, which contains 6

Target Details

	ATPase subunits and 2 non-ATPase subunits, and a lid, which contains up to 10 non-ATPase
	subunits. Proteasomes are distributed throughout eukaryotic cells at a high concentration and
	cleave peptides in an ATP/ubiquitin-dependent process in a non-lysosomal pathway. An
	essential function of a modified proteasome, the immunoproteasome, is the processing of
	class I MHC peptides. This gene encodes one of the ATPase subunits, a member of the triple-A
	family of ATPases which have a chaperone-like activity. Pseudogenes have been identified on
	chromosomes 8 and 12.
