transport chain which drives oxidative phosphorylation. The respiratory chain contains 3
multisubunit complexes succinate dehydrogenase (complex II, CII, ubiquinol-cytochrome c
oxidoreductase (cytochrome b-c1 complex, complex III, CIII and cytochrome c oxidase
(complex IV, CIV, that cooperate to transfer electrons derived from NADH and succinate to
molecular oxygen, creating an electrochemical gradient over the inner membrane that drives
transmembrane transport and the ATP synthase. Cytochrome c oxidase is the component of
the respiratory chain that catalyzes the reduction of oxygen to water. Electrons originating from
reduced cytochrome c in the intermembrane space (IMS are transferred via the dinuclear
copper A center (CU(A of subunit 2 and heme A of subunit 1 to the active site in subunit 1, a
binuclear center (BNC formed by heme A3 and copper B (CU(B. The BNC reduces molecular
oxygen to 2 water molecules using 4 electrons from cytochrome c in the IMS and 4 protons
