Target:	SPRY2
Alternative Name:	SPRY2 (SPRY2 Products)
Background:	This gene encodes a protein belonging to the sprouty family. The encoded protein contains a
	carboxyl-terminal cysteine-rich domain essential for the inhibitory activity on receptor tyrosine
	kinase signaling proteins and is required for growth factor stimulated translocation of the
	protein to membrane ruffles. In primary dermal endothelial cells this gene is transiently
	upregulated in response to fibroblast growth factor two. This protein is indirectly involved in the
	non-cell autonomous inhibitory effect on fibroblast growth factor two signaling. The protein
	interacts with Cas-Br-M (murine) ectropic retroviral transforming sequence, and can function as
	a bimodal regulator of epidermal growth factor receptor/mitogen-activated protein kinase
	signaling. This protein may play a role in alveoli branching during lung development as shown
	by a similar mouse protein.,SPRY2,IGAN3,hSPRY2,Signal Transduction,ErbB-HER Signaling
