Target Details	
Alternative Name:	MCK10 (DDR1 Products)
Background:	Background: Discoidin domain receptor family, member 1 (DDR1), also known as or CD167a
	(cluster of differentiation 167a), and Mammary carcinoma kinase 10 (MCK10), belongs to a
	subfamily of tyrosine kinase receptors with an extracellular domain homologous to
	Dictyostellium discoideum protein discoidin 1. Receptor tyrosine kinases play a key role in the
	communication of cells with their microenvironment. These kinases are involved in the
	regulation of cell growth, differentiation and metabolism. Expression of DDR1/MCK10/CD167 is
	restricted to epithelial cells, particularly in the kidney, lung, gastrointestinal tract, and brain. In
	addition, it has been shown to be significantly overexpressed in several human tumors.
	DDR1/MCK10/CD167 plays an important role in regulating attachment to collagen, chemotaxis,
	proliferation, and MMP production in smooth muscle cells. DDR1 functions in a feedforward
	loop to increase p53 levels and at least some of its effectors. Inhibition of DDR1 function
	resulted in strikingly increased apoptosis of wild-type p53-containing cells in response to
	genotoxic stress through a caspase-dependent pathway.
