Alternative Name:	Sialic acid-binding Ig-like lectin 15/Siglec-15/CD33L3 (SIGLEC15 Products)
Background:	Background: Human Siglec-15 is a transmembrane glycoprotein in the Siglec family. Siglecs are
	type I transmembrane proteins where the NH3+-terminus is in the extracellular space and the
	COOterminus is cytosolic. Each Siglec contains an N-terminal V-type immunoglobulin domain
	(Ig domain) which acts as the binding receptor for sialic acid. These lectins are placed into the
	group of I-type lectins because the lectin domain is an immunoglobulin fold. All Siglecs are
	extended from the cell surface by C2-type Ig domains which have no binding activity. Siglecs
	differ in the number of these C2-type domains. Human Siglec-15 consists of a 244 amino acid
	(aa) extracellular domain (ECD) with two Ig-like domains, a 21 aa transmembrane segment, and
	a 44 aa cytoplasmic domain. Siglec-15 function is important for osteoclast formation and
	TRANCE/RANK Ligand signaling in osteoclasts.
	Synonym: Angiopoietin-related protein 4, 425018-1, Angiopoietin-like protein 4, Fasting-induced
	adipose factor, Hepatic fibrinogen/angiopoietin-related protein, HFARP, Secreted protein Bk89,
	Angptl4, Farp, Fiaf, Ng27
