	type I membrane protein. LAIR1 expressed on the majority of peripheral mononuclear cells,
	including natural killer (NK) cells, T-cells, B-cells, monocytes, and dendritic cells, highly in naive
	T-cells and B-cells. As an inhibitory receptor, LAIR1 plays a constitutive negative regulatory role
	on cytolytic function of natural killer (NK) cells, B-cells and T-cells. Activation by Tyr
	phosphorylation results in recruitment and activation of the phosphatases PTPN6 and PTPN11.
	It also reduces the increase of intracellular calcium evoked by B-cell receptor ligation. LAIR1
	plays inhibitory role independently of SH2-containing phosphatases and modulates cytokine
	production in CD4+ T-cells. It down-regulates IL2 and IFNG production while inducing secretion
	of transforming growth factor beta, also down-regulates IgG and IgE production in B-cells as
	well as IL8, IL10 and TNF secretion. LAIR1 inhibits the differentiation of peripheral blood
	precursors towards dendritic cells. It also restrains proliferation and induces apoptosis in
	myeloid leukemia cell lines as well as prevents nuclear translocation of NF-kappa-B p65
	subunit/RELA and phosphorylation of I-kappa-B alpha/CHUK in these cells.
