Target Details

Target:	CSRP1
Alternative Name:	CSRP1 (CSRP1 Products)
Background:	Background: Cysteine and glycine-rich protein 1, also known as Cysteine-rich protein 1, CSRP1 and CSRP, is a member of the CSRP family which may be involved in regulatory processes
	important for development and cellular differentiation. CSRP1 contains two LIM zinc-binding domains. The LIM / double zinc-finger motif found in CSRP1 is found in a group of proteins with

	critical functions in gene regulation, cell growth, and somatic differentiation. Zebrafish CSRP1 is				
	expressed in the mesendoderm and its derivatives. CSRP1 interacts with Dishevelled 2 (Dvl2)				
	and Diversin (Div), which control cell morphology and other dynamic cell behaviors via the				
	noncanonical Wnt and JNK pathways. When CSRP1 message is knocked down, abnormal				
	convergent extension cell movement is induced, resulting in severe deformities in midline				
	structures. In addition, cardiac bifida is induced as a consequence of defects in cardiac mesoderm cell migration. CSRP1 acts as a key molecule of the noncanonical Wnt pathway,				
	which orchestrates cell behaviors during dynamic morphogenetic movements of tissues and				
	organs.
