Target Details

Target:	s100a4 (S100A4)
Alternative Name:	S100A4 (S100A4 Products)
Background:	Background: S100A4, also known as metastasis-associated protein Mtsl, belongs to the family of small calcium-binding S100 proteins containing two EF-hand calcium-binding motifs. In
	humans at least 20 S100 family members that are distributed tissue specifically have been

	identified, and are involved in a number of cellular processes as transducers of calcium signal.
	S100A4 is a symmetric homodimer, and undergoes a relatively large conformational change
	upon the typical EF-hand binding calcium, which is necessary for S100A4 to interact with its
	protein targets and generate biological effects. It can bind the already known targets p53, F-
	actin, liprin β , myosin heavy chain II, and prevent their phosphorylation and multimerization. It
	has been demonstrated that S100A4 is directly involved in tumor metastasis including cell
	motility, invasion, apoptosis, angiogenesis and differentiation, and appears to be a metastasis
	factor and a molecular marker for clinical prognosis. Multiple alternatively spliced variants
	encoding the same protein have been identified.
