	cytoplasmic domain. It is specifically expressed at endothelial tight junctions and on activated
	platelets. ESAM at endothelial tight junctions participates in the migration of neutrophils
	through the vessel wall, possibly by influencing endothelial cell contacts. The adaptor protein
	membrane-associated guanylate kinase MAGI-1 has been identified as an intracellular binding
	partner of ESAM. Previous studies have indicated that ESAM regulates angiogenesis in the
	primary tumor growth and endothelial permeability. It suggest that ESAM has a redundant
	functional role in physiological angiogenesis but serves a unique and essential role in
	pathological angiogenic processes such as tumor growth.
