Alternative Name:	IL18R1 (IL18R1 Products)
Background:	Background: Interleukin-18 receptor 1 (IL18R1) also known as CD218 antigen-like family member A, CDw218a, IL1 receptor-related protein and CD218a, is an interleukin receptor of the
	immunoglobulin superfamily. IL18R1 is found expressed in lung, leukocytes, spleen, liver,

	thymus, prostate, small intestine, colon, placenta, and heart, and is absent from brain, skeletal
	muscle, pancreas, and kidney. High level of expression is found in Hodgkin disease cell lines.
	This receptor is specifically binds interleukin 18 (IL18), and is essential for IL18 mediated signal
	transduction. IL18R1 contains 3 Ig-like C2-type (immunoglobulin-like) domains and 1 TIR
	domain. It is a single-pass type I membrane protein. IFN-alpha and IL12 are reported to induce
	the expression of this receptor in NK and T cells. The increased expression of IL18R1 may
	contribute pathogenically to disease and is therefore a potential therapeutic target. The
	absence of a genetic association in the IL18R1 gene itself suggests regulation from other parts
	of the genome, or as part of the inflammatory cascade in multiple sclerosis without a prime
	genetic cause.
