	adaptor protein (such as TRADD, TRAF, RIP), which is important in determining the outcome of				
	the response. LTBR is expressed on the surface of most cell types, including cells of epithelial				
	 and myeloid lineages, but not on T and B lymphocytes. LTBR specifically binds the lymphotoxin membrane form (a complex of lymphotoxin-alpha and lymphtoxin-beta). LTBR and its ligand play a role in the development and organization of lymphoid tissue and tranformed cells. Activation of this protein can trigger apoptosis. Not only does the LTBR help trigger apoptosis, it can lead to the release of the cytokine interleukin 8. Overexpression of LTBR in HEK293 cells 				
	increases IL-8 promoter activity and leads to IL-8 release. It is also essential for development				
	and organization of the secondary lymphoid organs and chemokine release.
