## Target Details

Background:	Synonyms: FDC, FDCs, Follicular dendritic cell, Follicular dendritic cell secreted protein,
	Follicular dendritic cell, Follicular dendritic cell secreted peptide, FDC secreted protein.
	Background: Follicular dendritic cells are cells that facilitate antigen recognition by B cells in
	follicles. This kind of dendritic cell is not bone marrow derived and is not a kind of blood cell. It
	is purely a resident of the follicles of secondary lymphoid organs. B cells form germinal centers
	around follicular dendritic cells in lymphoid organs. Dendritic cells form from monocytes, white
	blood cells which circulate in the body and, depending on the right signal, can turn into dendritic
	cells or macrophages. The monocytes in turn are formed from stem cells in the bone marrow.In
	normal tissue this antibody identifies dendritic cells and a proportion of B lymphocytes.
	Evidence in pathological tissue and functional studies suggests it binds to an epitope
	expressed by antigen presenting cells. Within the macrophage/dendritic cell populations the
	epitope seen by RFD1 is coexpressed with RFD7 by a subset of cells that exhibit suppressive
	activity on T cell stimulation.
