Target Details

Background:	Synonyms: AMPA 4, AMPA selective glutamate receptor 4, GluR 4, GluR D, GLUR4, GLUR4C, GLURD, Glutamate receptor 4, Glutamate receptor ionotropic AMPA 4, GRIA 4, GRIA4, GRIA4_HUMAN. Background: Glutamate receptors are the predominant excitatory neurotransmitter receptors in the mammalian brain and are activated in a variety of normal neurophysiologic processes. These receptors are heteromeric protein complexes composed of multiple subunits, arranged to form ligand-gated ion channels. The classification of glutamate receptors is based on their activation by different pharmacologic agonists. The subunit encoded by this gene belongs to a family of AMPA (alpha-amino-3-hydroxy-5-methyl-4-isoxazole propionate)-sensitive glutamate receptors, and is subject to RNA editing (AGA->GGA, R->G). Alternative splicing of this gene results in transcript variants encoding different isoforms, which may vary in their signal transduction properties.
