	Background: This gene encodes a member of the human ARF gene family, which is part of the
	RAS superfamily. The ARF genes encode small guanine nucleotide-binding proteins that
	stimulate the ADP-ribosyltransferase activity of cholera toxin and play a role in vesicular
	trafficking and as activators of phospholipase D. The product of this gene is localized to the
	plasma membrane, and regulates vesicular trafficking, remodelling of membrane lipids, and
	signaling pathways that lead to actin remodeling. A pseudogene of this gene is located on
	chromosome 7.
Gene ID:	382
Pathways:	Steroid Hormone Mediated Signaling Pathway, Regulation of Actin Filament Polymerization,
	SARS-CoV-2 Protein Interactome
