	Background: The protein encoded by this gene belongs to the ferlin family and is a skeletal
	muscle protein found associated with the sarcolemma. It is involved in muscle contraction and
	contains C2 domains that play a role in calcium-mediated membrane fusion events, suggesting
	that it may be involved in membrane regeneration and repair. In addition, the protein encoded
	by this gene binds caveolin-3, a skeletal muscle membrane protein which is important in the
	formation of caveolae. Specific mutations in this gene have been shown to cause autosomal
	recessive limb girdle muscular dystrophy type 2B (LGMD2B) as well as Miyoshi myopathy.
	Alternative splicing results in multiple transcript variants. [provided by RefSeq, Aug 2008].
